

product_id: cryptocurrency_corecoin
name: CoreCoin (CORE)
risk_level: High (Financial/Investment)
category_focus: Finance/Investment – Digital Asset
region: Global (jurisdiction-dependent)
target_audience: Experienced investors aged 30–65 with high risk tolerance. Individuals seeking diversification into digital assets. Users comfortable with self-custody and blockchain transactions.
tone: Cautious, Informative, and Professional – No hype, speculation, or promotional exaggeration.
specs:
 fundamentals:
 – CoreCoin is a decentralized Layer-1 digital asset
 – Operates on a Proof-of-Stake (PoS) blockchain
 – Provides peer-to-peer value transfer without intermediaries
 – Supports smart contracts and decentralized application integration
 – Decentralized digital asset (operates independently of government/bank control)
 – Digital-only asset requiring compatible wallet software
 – Exists only in digital form (not a physical coin, certificate, or bearer instrument)
 market_characteristics:
 – Market value is highly volatile and influenced by liquidity, market sentiment, and macroeconomic conditions
 – Liquidity varies by exchange and market conditions
 – Price discovery occurs through decentralized market mechanisms
 technical_architecture:
 consensus: Proof-of-Stake (PoS)
 average_block_time: ~5 seconds (varies with network load)
 maximum_supply: 2,000,000,000 CORE
 finality_target: ~2 blocks (~10 seconds) under normal conditions
 smart_contract_support: Yes (PoS-compatible VM)
 chain_governance: Community-driven on-chain governance
 cryptography:
 – Cryptographic signatures for transaction validation
 – 'Signature scheme: ECDSA or Ed25519'
 – 'Hashing algorithm: SHA-3 or equivalent'
 interoperability: Not natively cross-chain compatible unless explicitly specified
 network_features:
 – Transactions recorded on a public, tamper-resistant ledger
 – Users retain control of their private keys and funds
 – On-chain activity permanently recorded and viewable through public block explorers
 – Node count, validator distribution, and geographic decentralization may vary over time
 – Software clients are open-source and maintained by independent contributors

- Network relies on distributed validator participation
- Network uptime depends on distributed validator set
- staking_details:
 - Staking requires locking tokens for defined protocol periods (variable by governance)
 - 'Minimum stake: Protocol-defined threshold'
 - 'Lockup period: Variable (governance-defined)'
 - Staking rewards are variable and depend on network conditions (NOT guaranteed or fixed-rate)
 - Staking allows users to support network security
 - Rewards depend on network participation and validator performance
- fee_structure:
 - 'Fee model: Base fee + variable priority fee (market-driven)'
 - Gas fees fluctuate based on block space demand
 - Transaction fees paid in CORE
 - Network performance (latency, throughput, gas fees) varies with network congestion
- DApp interactions require on-chain gas fees
- custody_requirements:
 - Can be stored on hardware wallets, mobile wallets, or desktop clients (compatibility varies)
 - Private keys cannot be recovered if lost; custody responsibility lies with the user
 - Users must securely store private keys
 - Self-custody model with no third-party key recovery
- governance:
 - Protocol updates require community or validator approval
 - On-chain governance votes publicly recorded
 - Open-source governance enables community oversight
 - Governance participation depends on wallet integration and token ownership
- developer_ecosystem:
 - Open-source codebase available for public review
 - SDK available (language support varies)
 - Public and private RPC nodes available
 - Documentation version-controlled and publicly maintained
- security_quality:
 - audits:
 - Subject to independent third-party security audits (e.g., CertiK)
 - Client software undergoes peer review and continuous patching
 - Security audits assess consensus stability and smart contract risk
 - risk
 - No guarantee of complete security; vulnerabilities may exist
 - transparency:
 - Public ledger provides transparent transaction history
 - On-chain activity viewable through block explorers
 - Open-source codebase enables public review
 - Validators and full nodes operate independently (not centrally operated)
 - node_requirements:

hardware: Commodity hardware (exact specs depend on software client)

software: Open-source node client

mandatory_statements:

- Cryptocurrency investments involve risk and are highly volatile.
- Do not invest funds you cannot afford to lose.
- CoreCoin is not backed by the FDIC or any government entity.
- Past performance is not indicative of future results.
- Loss of private keys leads to permanent loss of funds.
- Digital assets may be vulnerable to hacking or protocol exploits.
- Market conditions can change rapidly and unpredictably.
- Regulatory changes may affect accessibility or legality.

risk_disclosure: Cryptocurrency investments involve high risk and volatility. Values can fluctuate widely and may result in loss of principal. Network performance and fees vary with demand and network conditions. Users are responsible for compliance with local laws and regulations; availability may vary by jurisdiction.

terminology_guidance: Avoid terms such as 'currency,' 'security,' 'deposit,' unless legally accurate. Marketing must not imply universal regulatory approval.

regulatory_classification:

status:

- Classification varies by jurisdiction (commodity/digital asset/virtual asset)
- Not legal tender
- Not FDIC-insured
- Not a bank account, deposit, or insured investment account
- Not SIPC-insured
- May be subject to securities/commodities regulations depending on location

compliance:

- Users are responsible for compliance with local laws and regulations
- Availability may vary by jurisdiction
- Not universally approved by regulatory authorities

authorized_claims:

transparency_control:

- Provides transparency via a public, tamper-resistant ledger
- Offers transparency through a public ledger that resists tampering

tampering

- Ensures transparency with a tamper-resistant public ledger
- Provides transparency using a public ledger designed to prevent tampering

tampering

- Transparency is provided via a public ledger that is tamper-resistant
- Allows users to maintain custody and control of their digital assets
- Gives users the ability to retain possession and authority over their digital assets

- Enables users to keep their digital assets in their own custody and under their control
- Lets users maintain control and custody of their digital property
- Users can retain control and custody of their digital assets
- Open-source codebase enables community review and transparency
- The open-source nature of the codebase allows for community review and ensures transparency.
- Community review and transparency are possible due to the open-source codebase.
- Because the codebase is open-source, the community can review it, promoting transparency.
- The open-source codebase facilitates community review, ensuring transparency.
- functionality:
 - Enables peer-to-peer value transfer
 - Supports decentralized applications and programmable smart contracts
 - Facilitates peer-to-peer transactions
 - Provides borderless transaction capability
 - Supports DeFi integration for decentralized finance applications
- network_security:
 - Staking allows users to support network security (rewards not guaranteed)
 - Network secured through distributed validator participation
 - Subject to third-party security audits for protocol integrity
 - Cryptographic signatures ensure transaction validation
- potential_utility:
 - May offer long-term utility as a digital value storage mechanism (non-guaranteed)
 - Potential long-term store of value (stated cautiously, non-guaranteed)
 - Designed for long-term digital asset ecosystem participation
- governance:
 - Community-driven governance enables stakeholder participation
 - Open-source governance enables community oversight
 - Protocol changes subject to community or validator approval
- prohibited_or_unsupported_claims:
 - investment_guarantees:
 - Guaranteed profit, yields, interest, or returns
 - Claims of 'risk-free,' 'stable,' or 'guaranteed growth'
 - Predicting future price increases or performance
 - Fixed or guaranteed staking returns/yields
 - Claims of inevitable adoption or value appreciation
 - regulatory_authority:
 - Claims of SEC, MiCA, FCA, or central-bank approval
 - Implying FDIC, SIPC, or government insurance
 - hype_urgency:
 - Don't miss out, moonshot, limited-time opportunity
 - FOMO-inducing language or artificial scarcity claims
 - Claims promoting urgency (e.g., 'limited-time bonus')
 - Pump, moon, or other speculative terminology

comparisons_analogies:

- Comparing to stocks, bonds, bank accounts, or insurance products
- Equating to regulated financial products without disclaimers
- Claims that it functions as traditional currency

technical_hallucinations:

- Zero-gas transactions or fixed-fee claims
- Quantum resistance or unbreakable security claims
- Features not implemented (e.g., sharding, cross-chain bridges, instantaneous finality)

instantaneous finality)

- Claims of hack-proof or 100% secure status
- Private key recovery by developers or foundation
- Censorship-proof, seizure-proof, or tax-exempt claims
- Automatic key recovery, backup, or sharding mechanisms
- Self-custody with third-party recovery options
- Passwordless account access or biometric-only security without private keys

market_operations:

- Regional or geographic trading restrictions or pauses
- Market circuit breakers or trading halts
- Trading hours, time-zone limitations, or maintenance windows

affecting trading

- Centralized market-making or liquidity guarantees
- Manual intervention in trading or settlement processes
- Claims of controlled volatility or price stability mechanisms
- Scheduled downtime or regional service interruptions

governance_violations:

- Governance proposals auto-approve or auto-pass without voting
- No quorum requirements for protocol changes
- Centralized veto power or admin keys (unless explicitly disclosed in specs)

disclosed in specs)

- Automatic execution of proposals without community vote
- Governance votes that bypass validator or stakeholder approval
- Token-weighted voting without minimum stake requirements
- Protocol changes without on-chain governance process

economic_geopolitical:

- Hedge against inflation, recession, or geopolitical instability
- Replacement for fiat currency
- Protection from government monetary policy
- Safe haven asset claims

endorsement_authority:

- Claims of investment by major institutions or celebrities

without verification

- Implied endorsement by regulators, governments, or financial institutions

institutions

- Claims of being 'recommended by experts' without substantiation

clarifications:

- Blockchain transparency does not protect against losses or fraud
- Decentralization does not imply regulatory immunity
- Public ledger does not guarantee anonymity
- Transactions may be traceable depending on analysis tools
- Smart contract code may contain vulnerabilities
- On-chain transactions are recorded on public blockchain (verifiable but not editing history)
- Staking rewards are variable and NOT guaranteed or fixed-rate

- Network performance depends on validator participation
- Transaction settlement depends on network health
- Gas fees are variable and market-driven
- Network uptime not guaranteed
- Users are solely responsible for private key security
- Lost private keys cannot be recovered
- No customer support for lost keys or failed transactions
- Self-custody requires technical knowledge and security practices
- Does NOT support non-staking light validators
- Smart contract execution requires gas fees (NOT gas-free or zero-fee)
- Governance proposals require quorum thresholds (NOT auto-pass without approval)
- NOT natively cross-chain compatible (RPC does NOT simulate cross-chain calls)
- Unstaking does NOT reduce or affect historical reward calculations
- Validator inactivity does NOT lock governance voting rights
- Staking rewards are NOT region-based and NOT fixed-rate tiers

usage_instructions:

requirements:

- Requires a digital wallet compatible with CoreCoin
- Users must securely store private keys
- Requires understanding of blockchain transactions
- Transaction fees must be paid in CORE

staking_participation:

- Staking requires locking CORE tokens
- Lockup periods defined by protocol governance
- Rewards vary based on network conditions
- Minimum stake threshold applies

governance:

- Governance participation requires token ownership
- Voting depends on wallet integration
- Protocol changes subject to community approval process

safety_warnings:

financial_risks:

- Cryptocurrency investments involve high risk and volatility
- Do not invest money you cannot afford to lose
- Past performance does not predict future results
- Market conditions can change rapidly and unpredictably
- Total loss of investment is possible

technical_risks:

- Loss of private keys leads to permanent loss of funds
- Digital assets may be vulnerable to hacking or protocol exploits
- Smart contracts may contain vulnerabilities
- Network performance may degrade during high congestion
- No guarantee of complete security; vulnerabilities may exist

regulatory_risks:

- Regulatory changes may affect accessibility or legality
- Classification varies by jurisdiction
- Users responsible for compliance with local laws
- Future regulation may restrict usage or trading

brand_values:

- Commitment to open-source transparency and community governance

- Focus on decentralization and user sovereignty
- Independent third-party security audits for protocol integrity
- Public verifiability of all network activity
- Community-driven development and protocol evolution
- Emphasis on informed participation over speculative hype
